

Lecture 4c - ARP

Type Lecture

Materials Empty

Reviewed

1. MAC and IP
2. End-to-end connectivity, MAC, and IP
3. ARP
4. ARP table
5. Quizzes

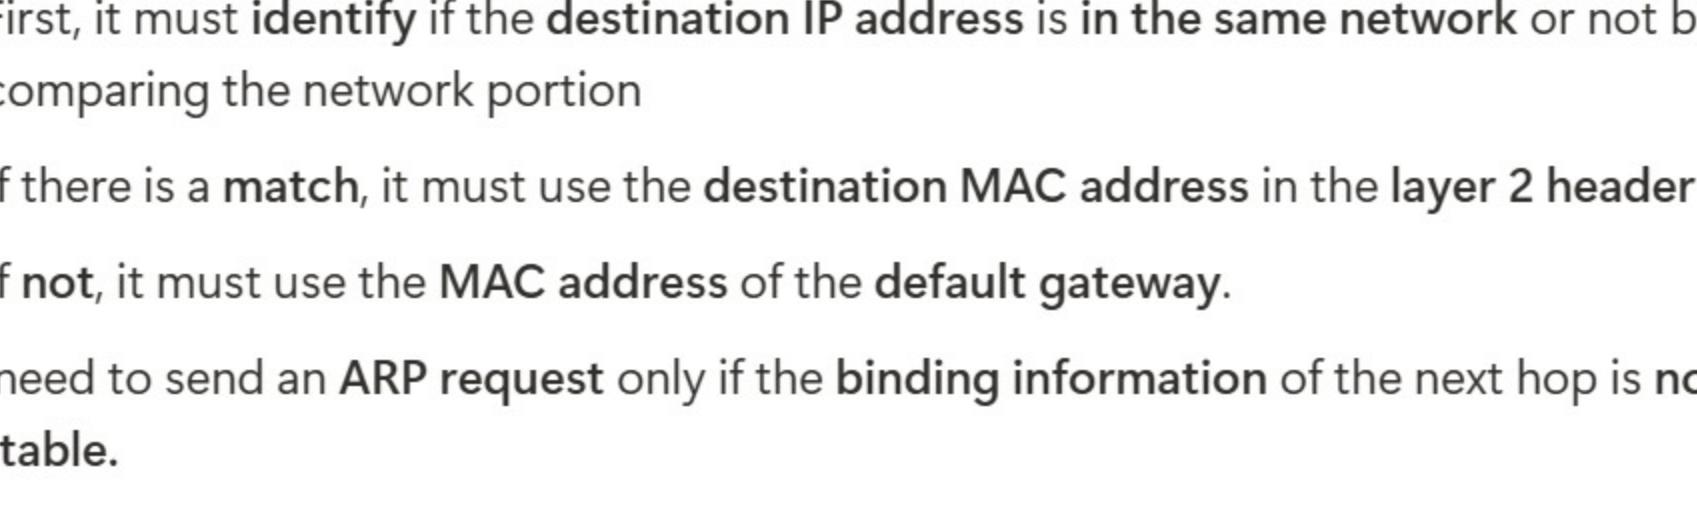

1. MAC and IP

- MAC Address
 - This address **does not change**
 - Similar to the **name** of a person
 - Known as **physical address** – physically assigned to the host NIC
 - Assigned by the vendor
- IP Address
 - Similar to the **address** of a person
 - Based on **where** the host is actually **located**
 - Known as a **logical address** because assigned logically
 - Assigned to each host by a **network administrator**
- Both the **physical MAC** and **logical IP** addresses are required for a computer to communicate just like both the **name** and **address** of a person are required to send a letter.

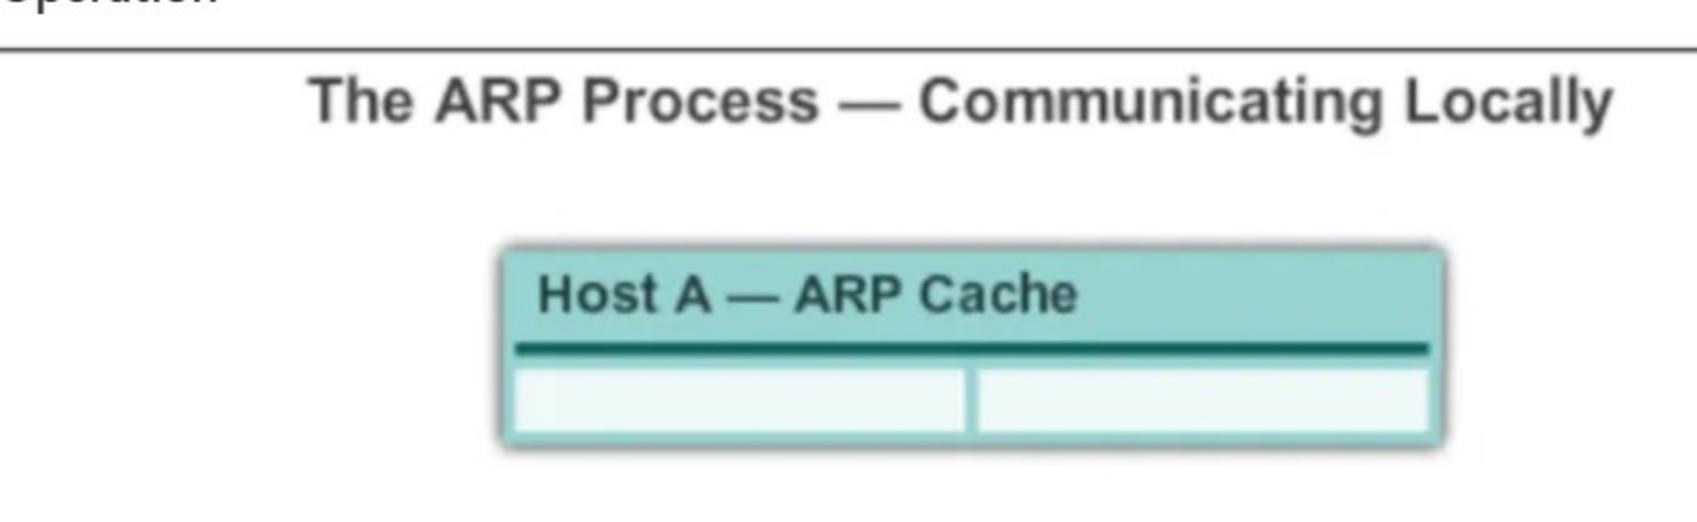

2. End-to-end connectivity, MAC, and IP

- IP Packet Encapsulated in an Ethernet Frame

- A switch examines MAC addresses

- A router examines IP addresses

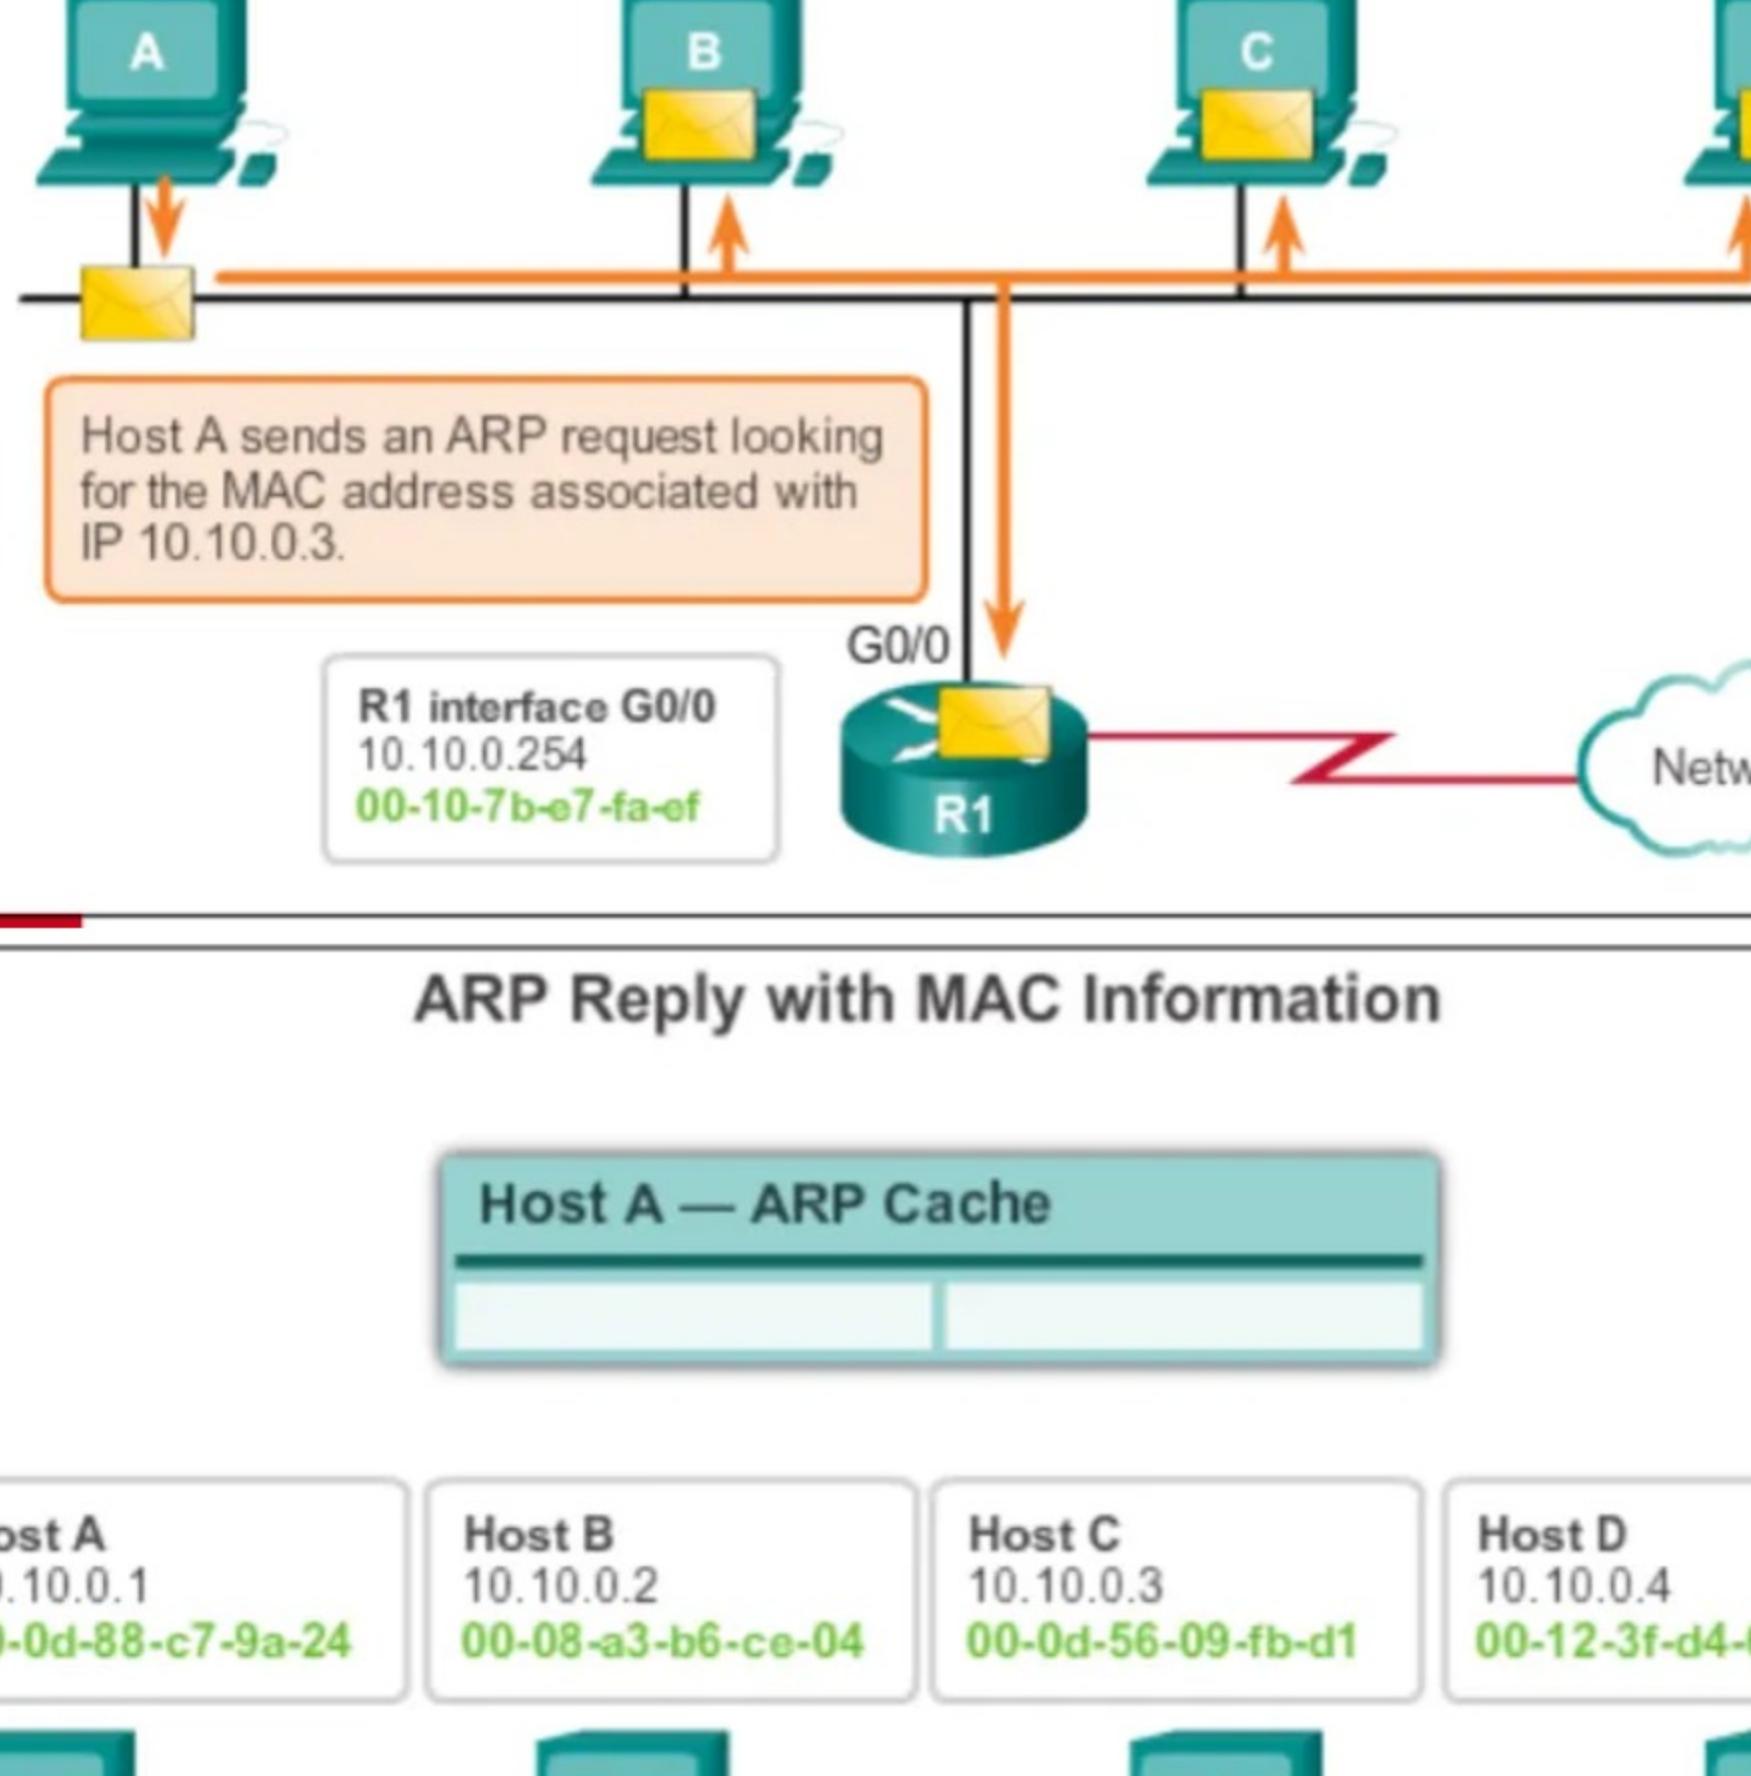

3. ARP

- Introduction to ARP

- Once data is encapsulated in a Layer 3 packet containing IP addressing information, the Layer 2 sub-system will encapsulate the packet in a frame containing source and destination MAC addresses.
 - As opposed to IP addresses, there isn't a global system to match destination hostnames to MAC addresses. For this, the sender needs to bind the **destination IP address** to a **destination MAC address** using the **ARP (Address Resolution Protocol)**.

I need to send information to 192.168.1.7, but I only have the IP address. I don't know the MAC address of the device that has that IP.

- When a host wants to send a packet to a known IP address:

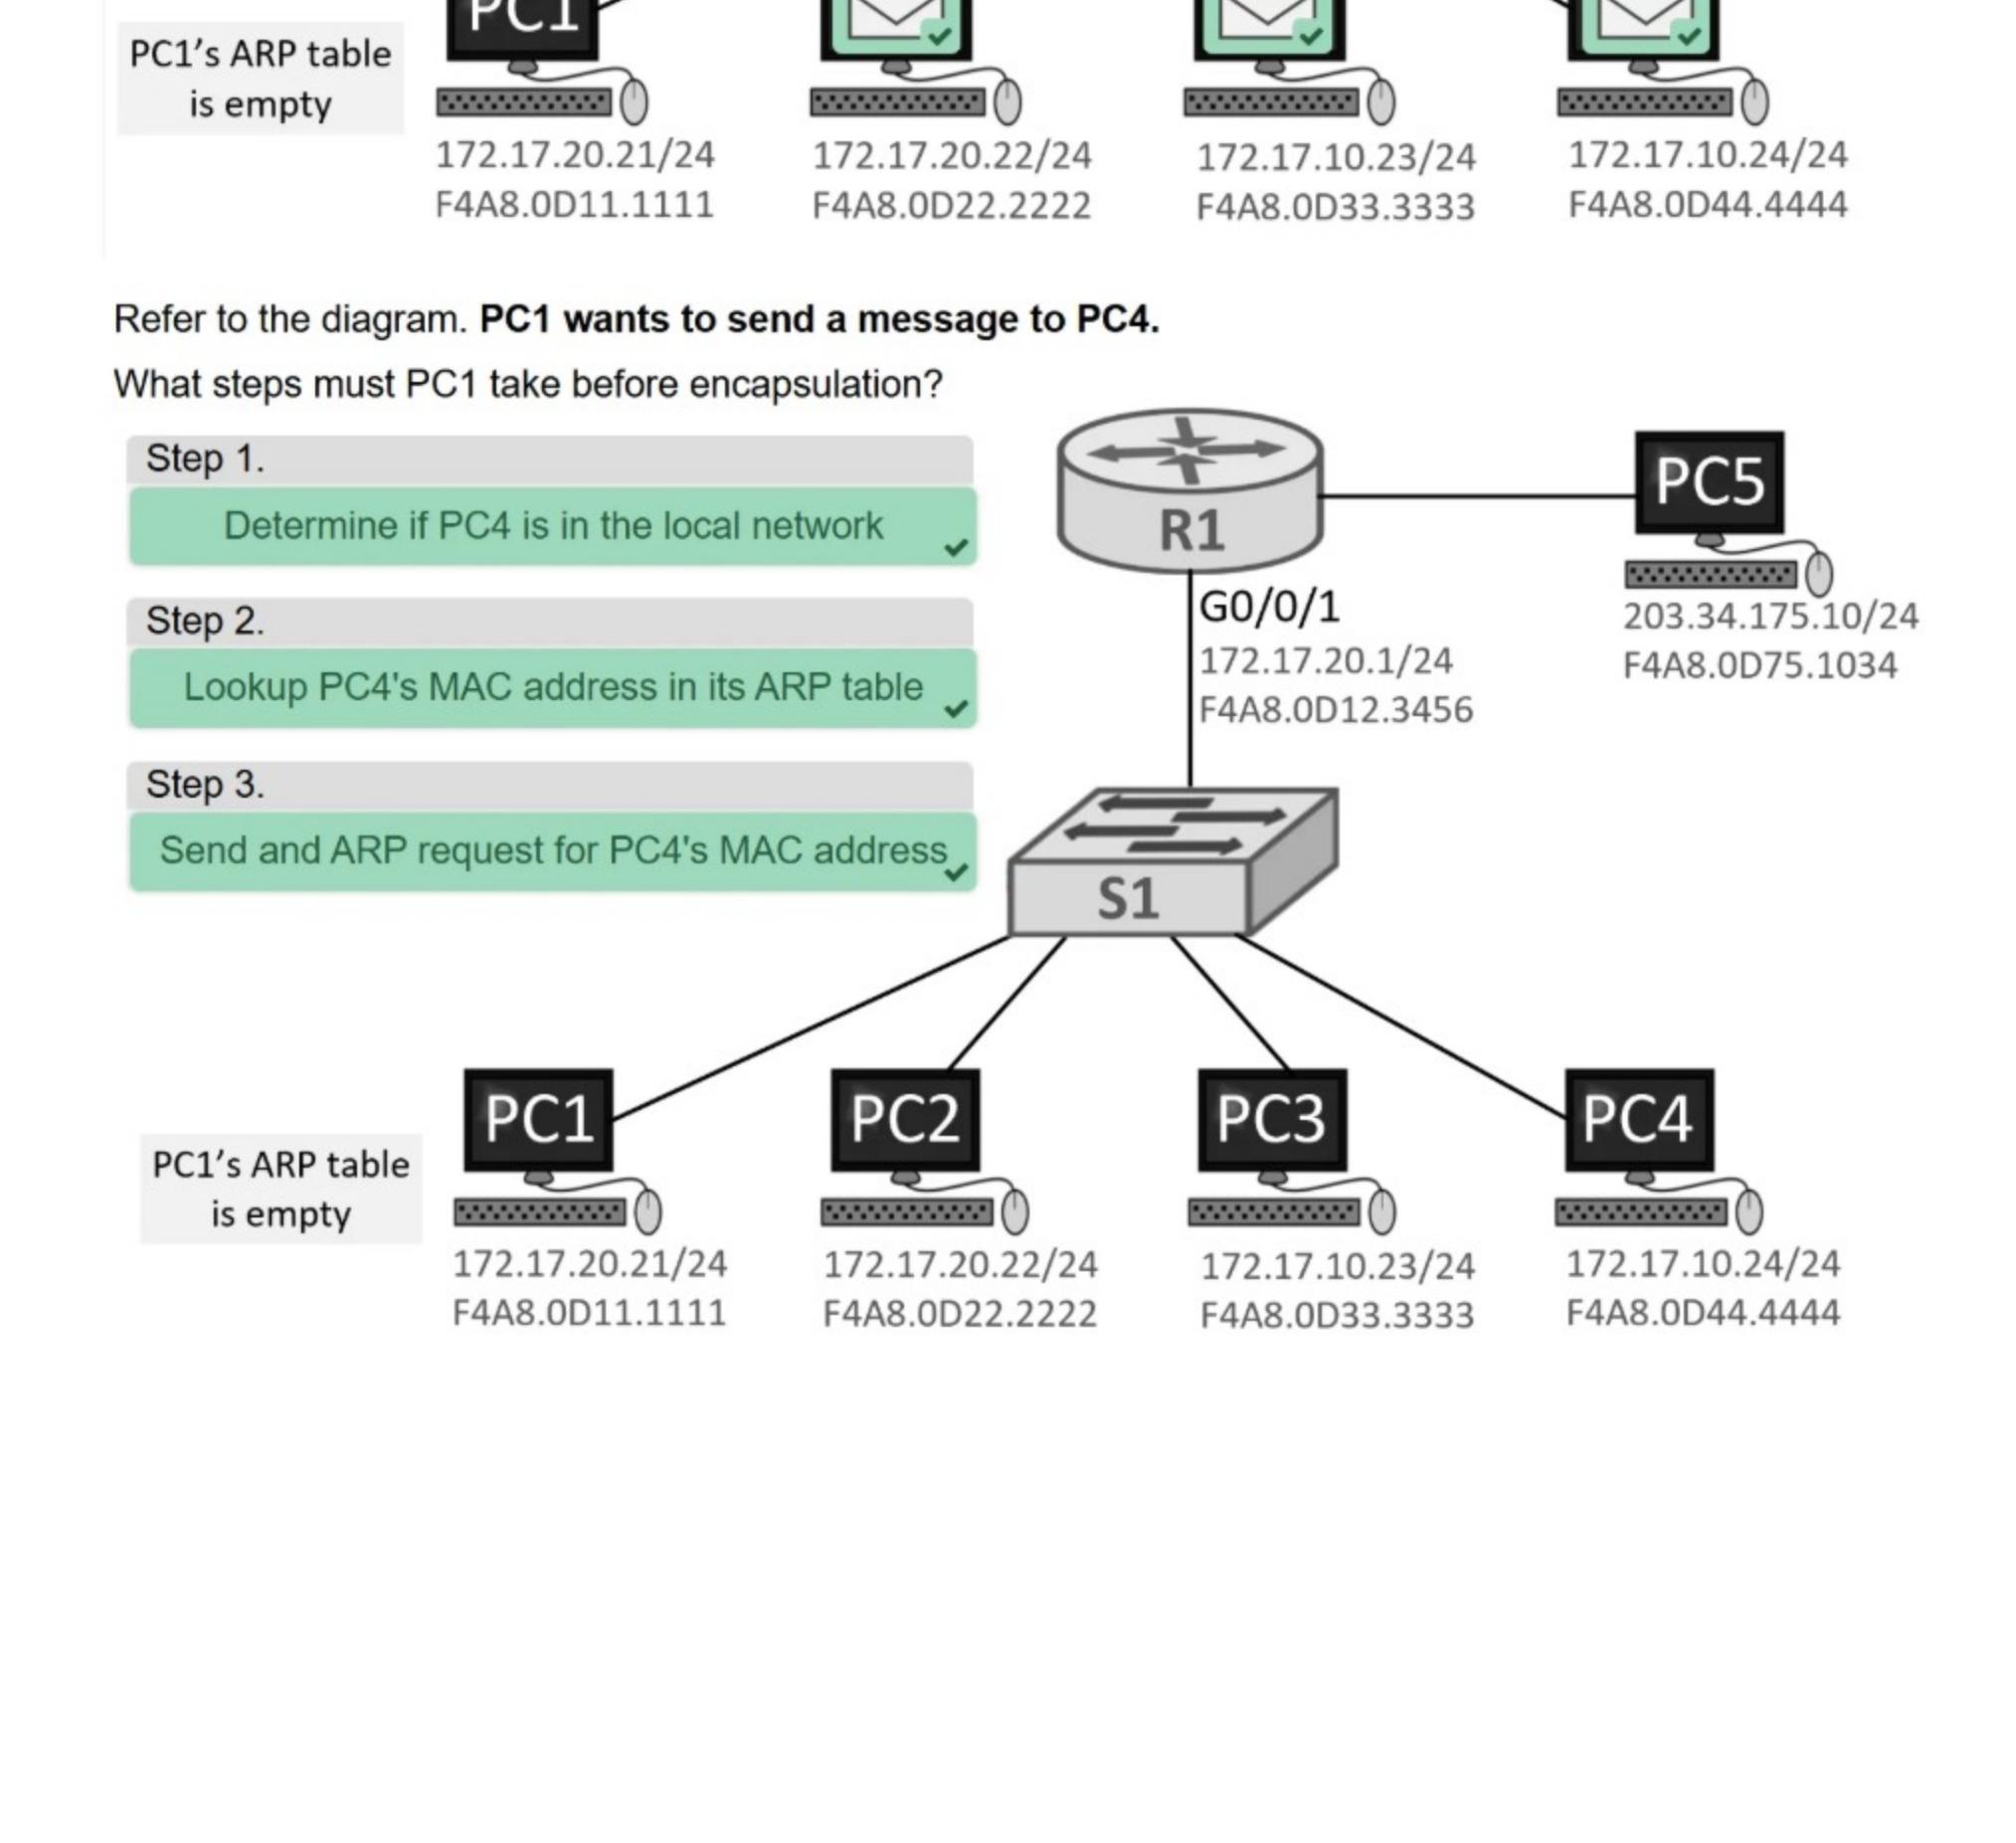

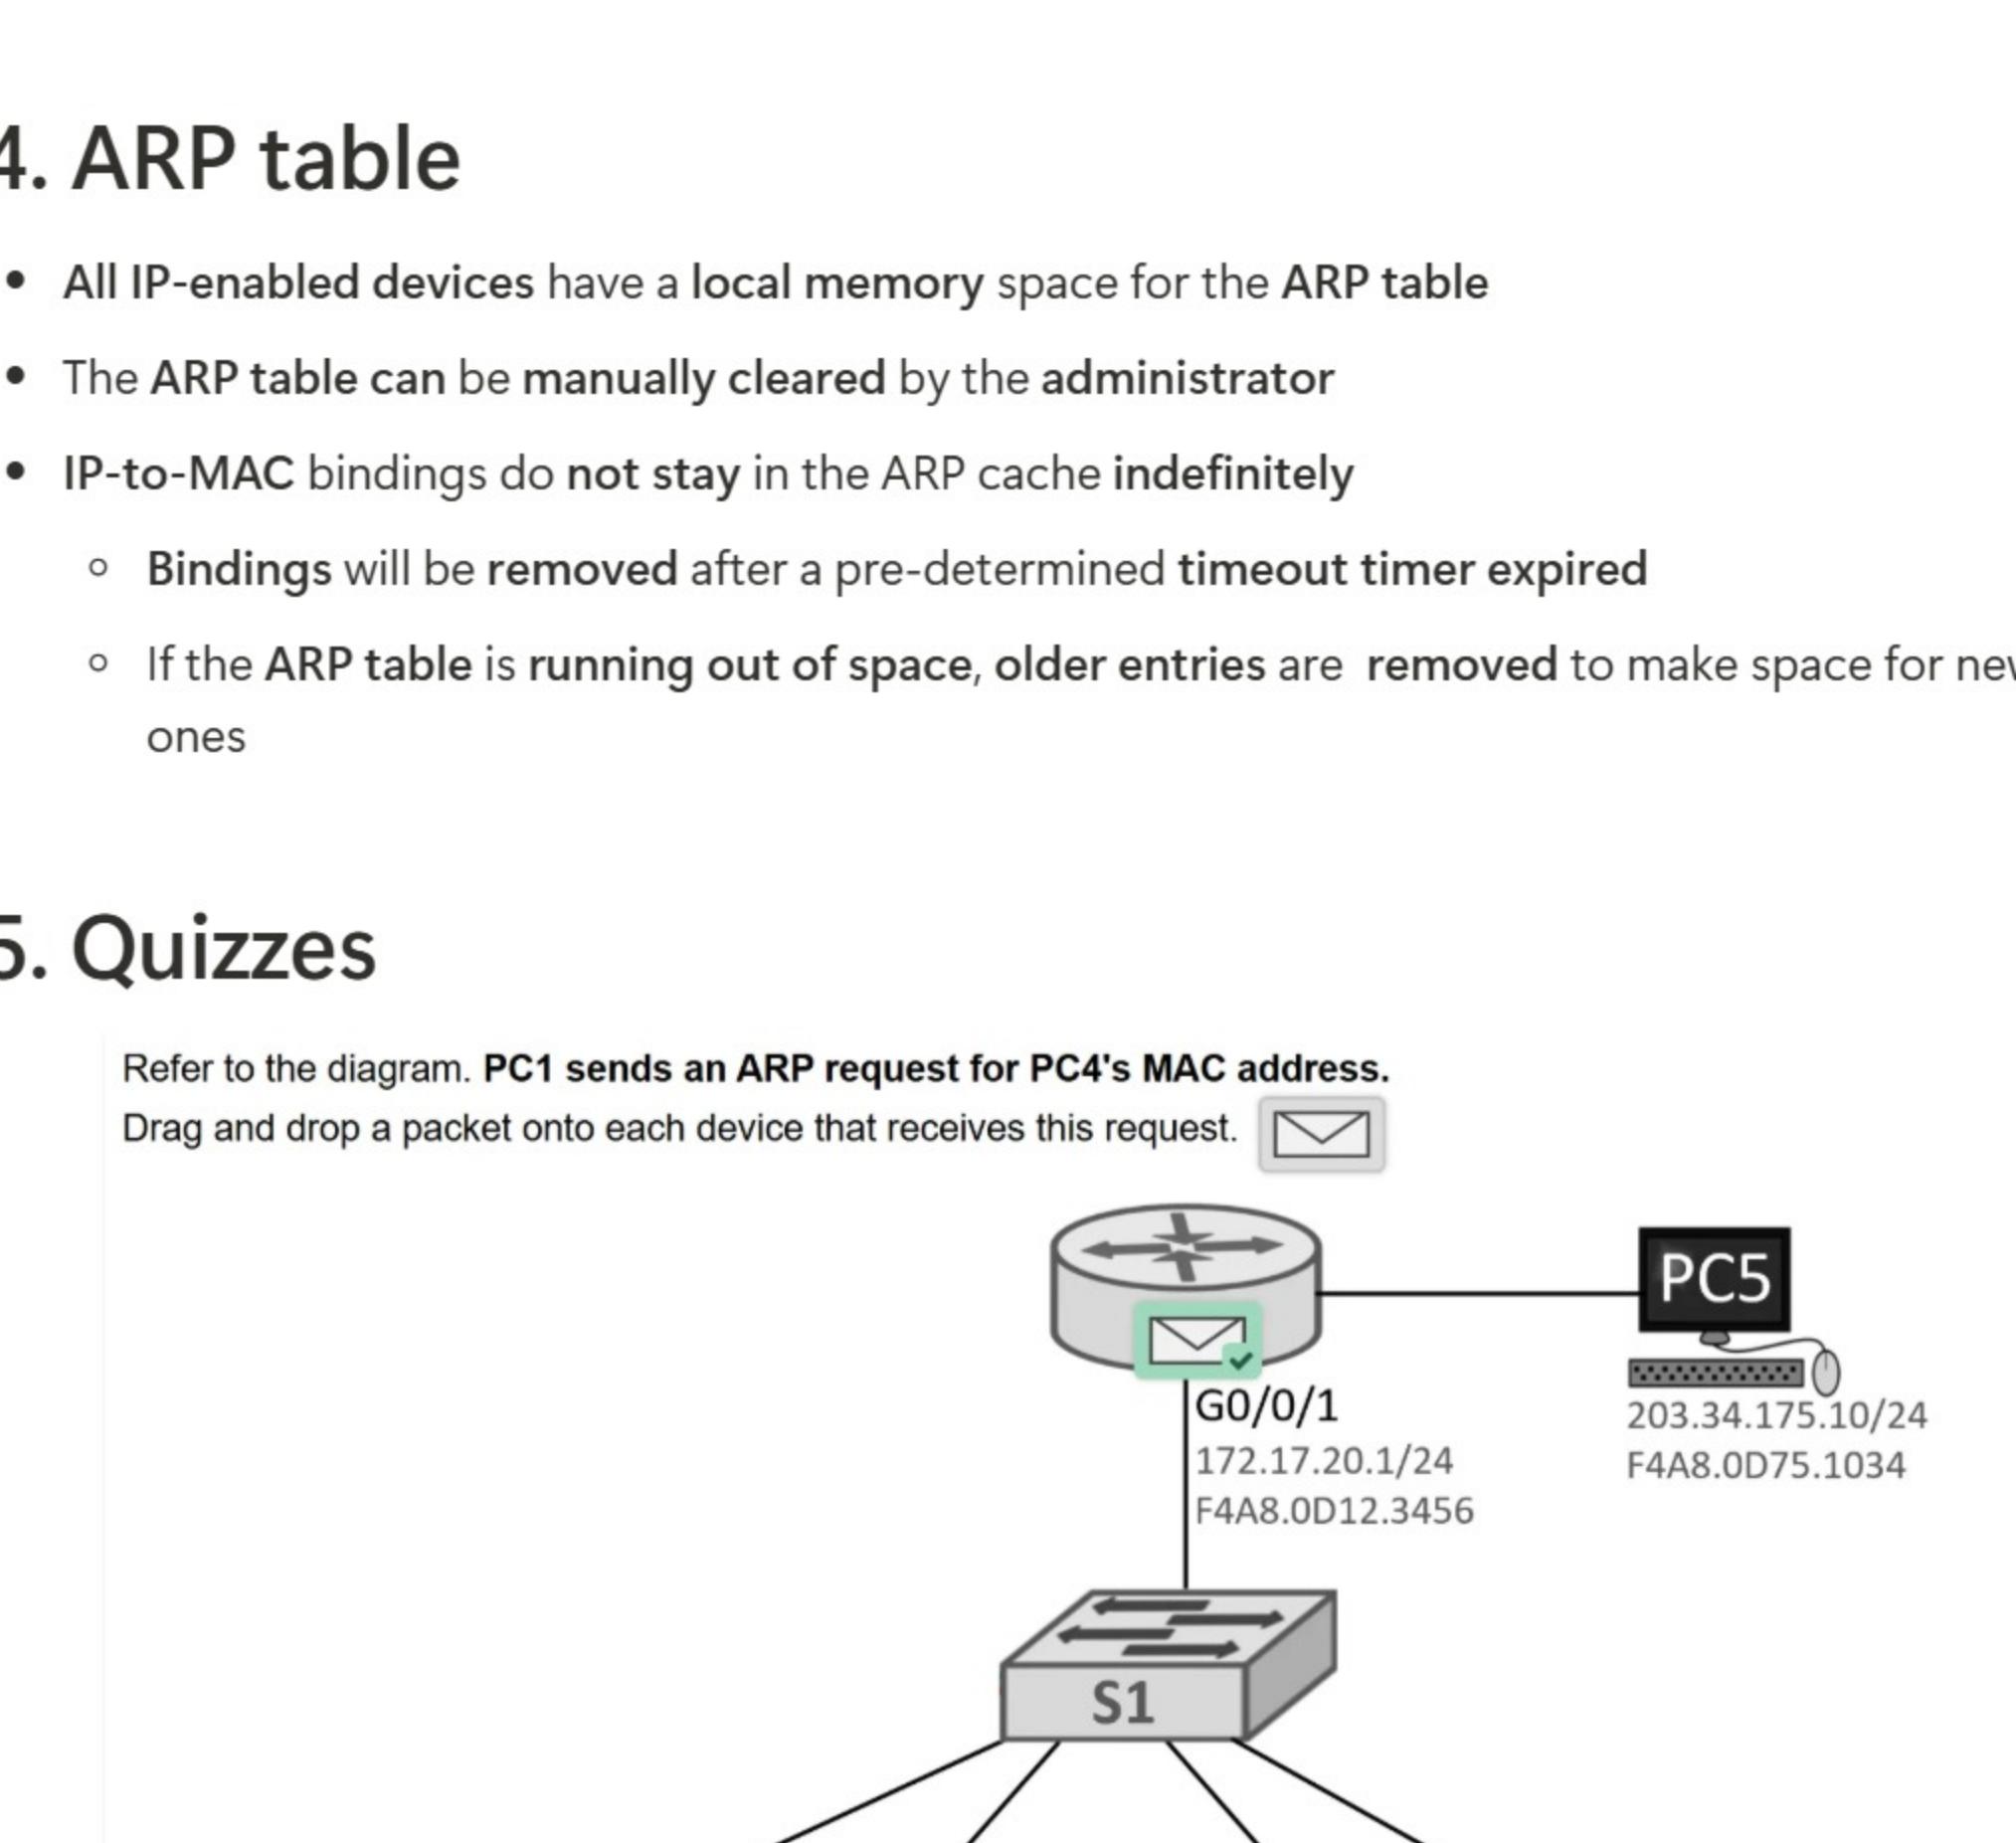

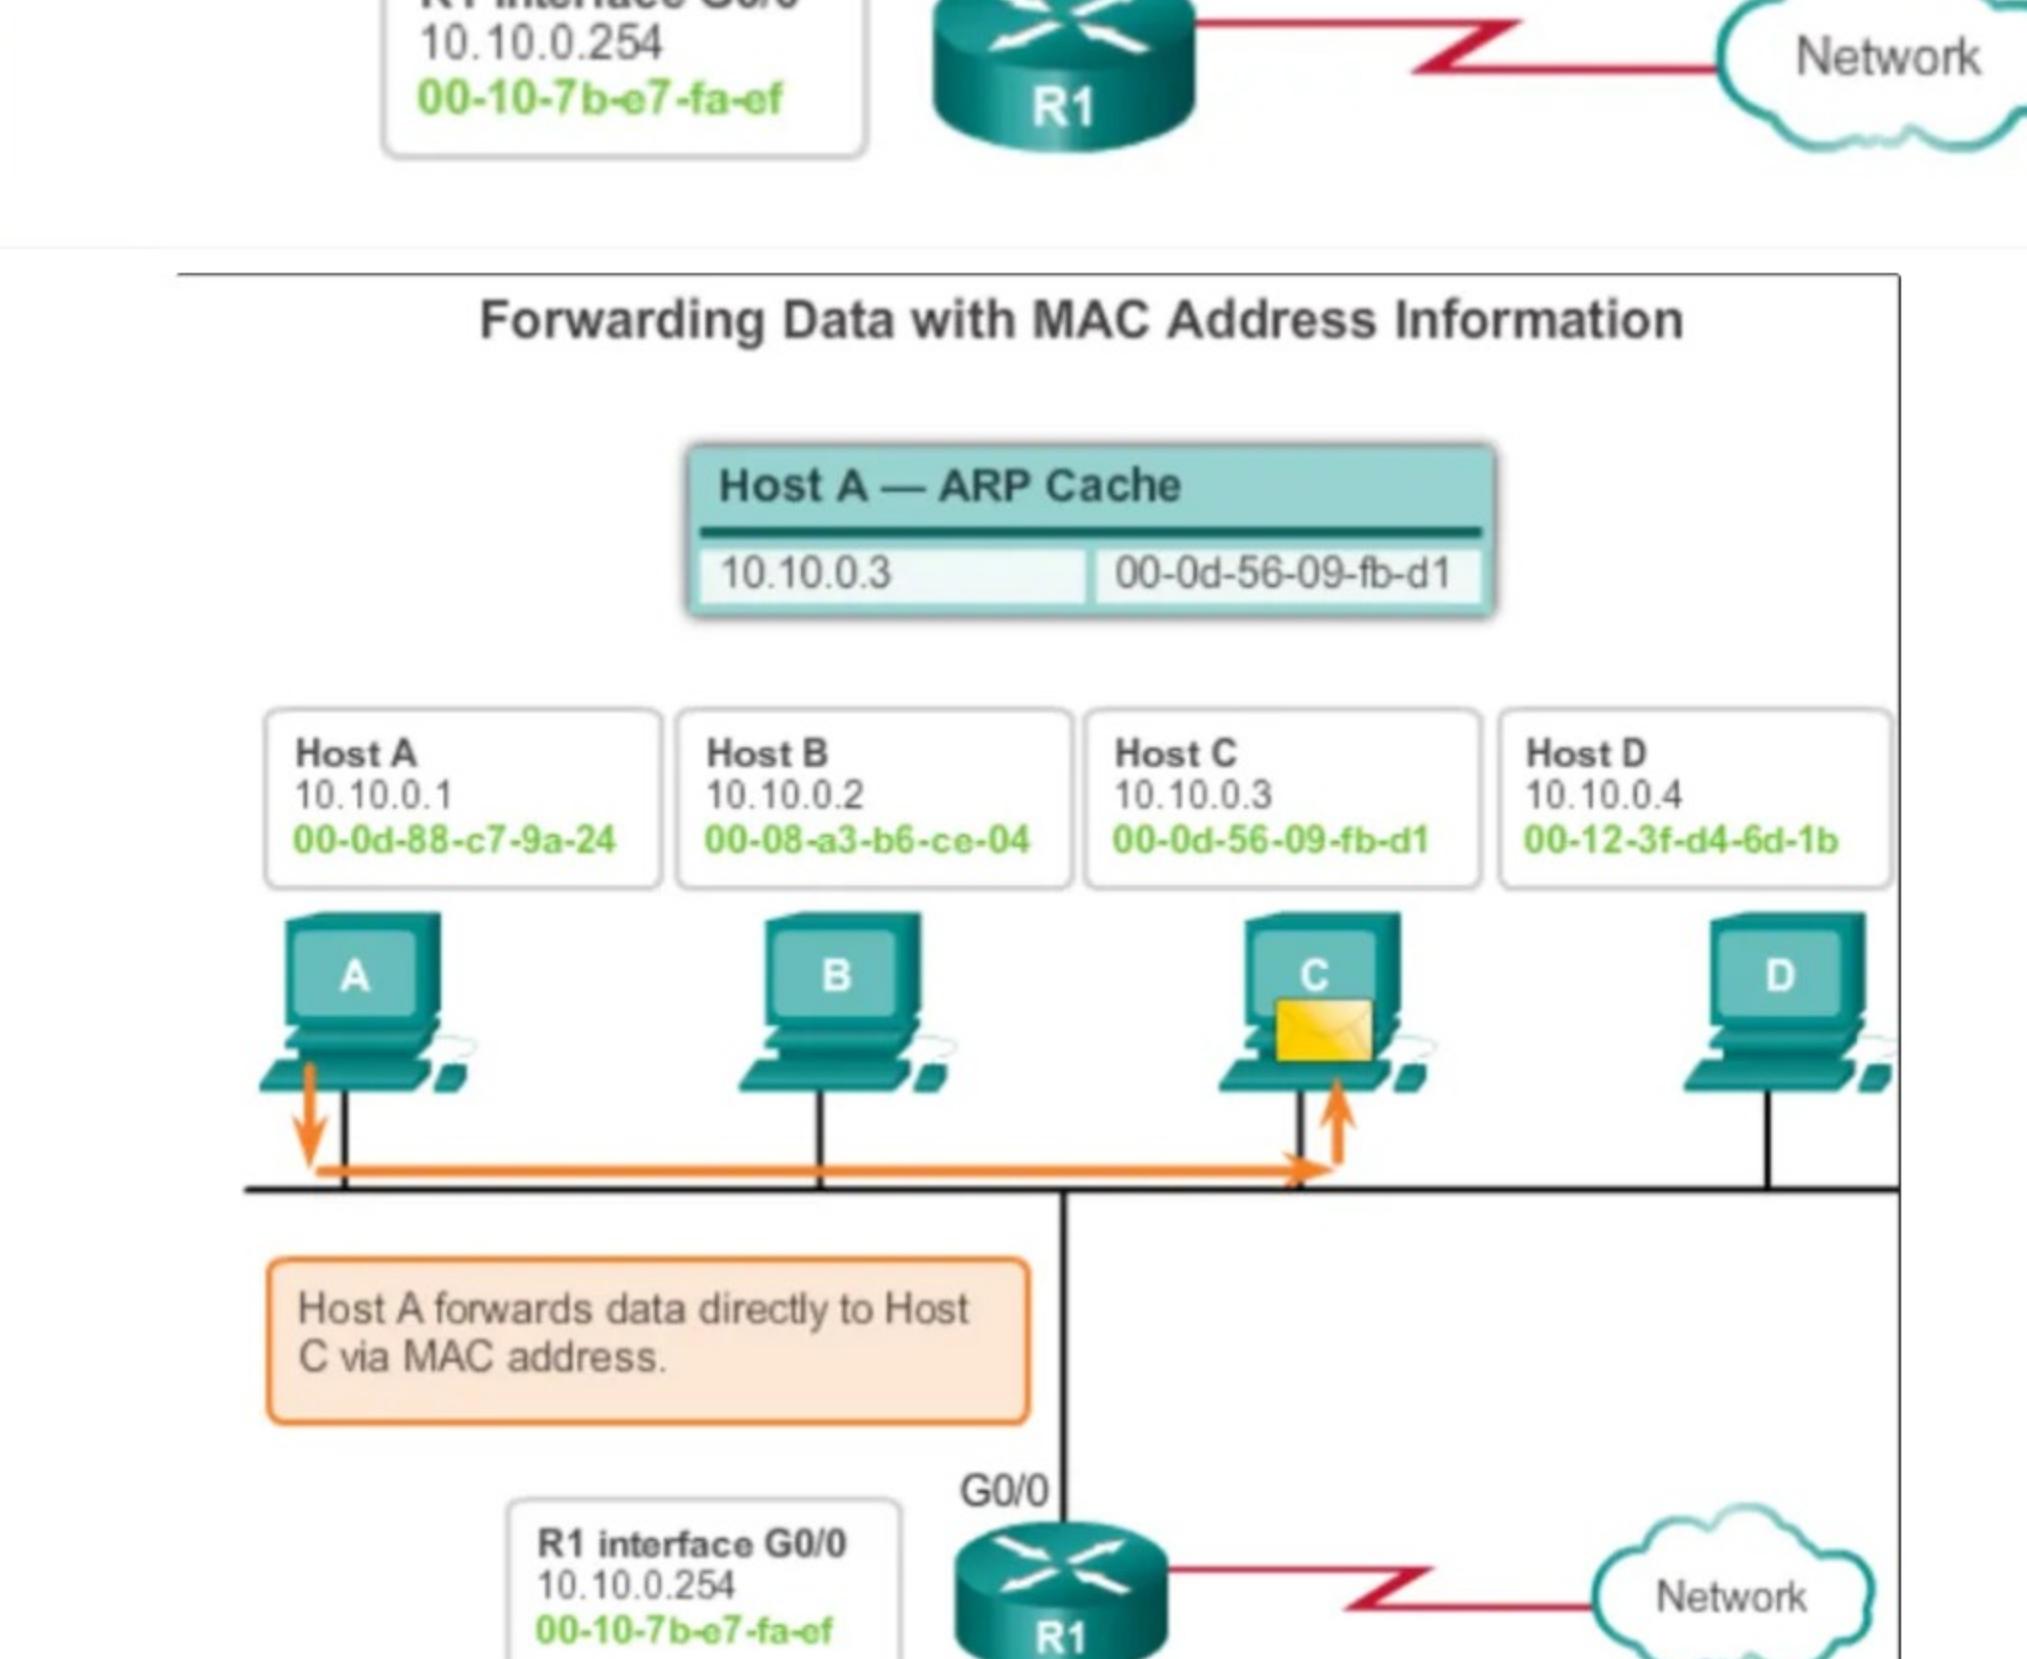

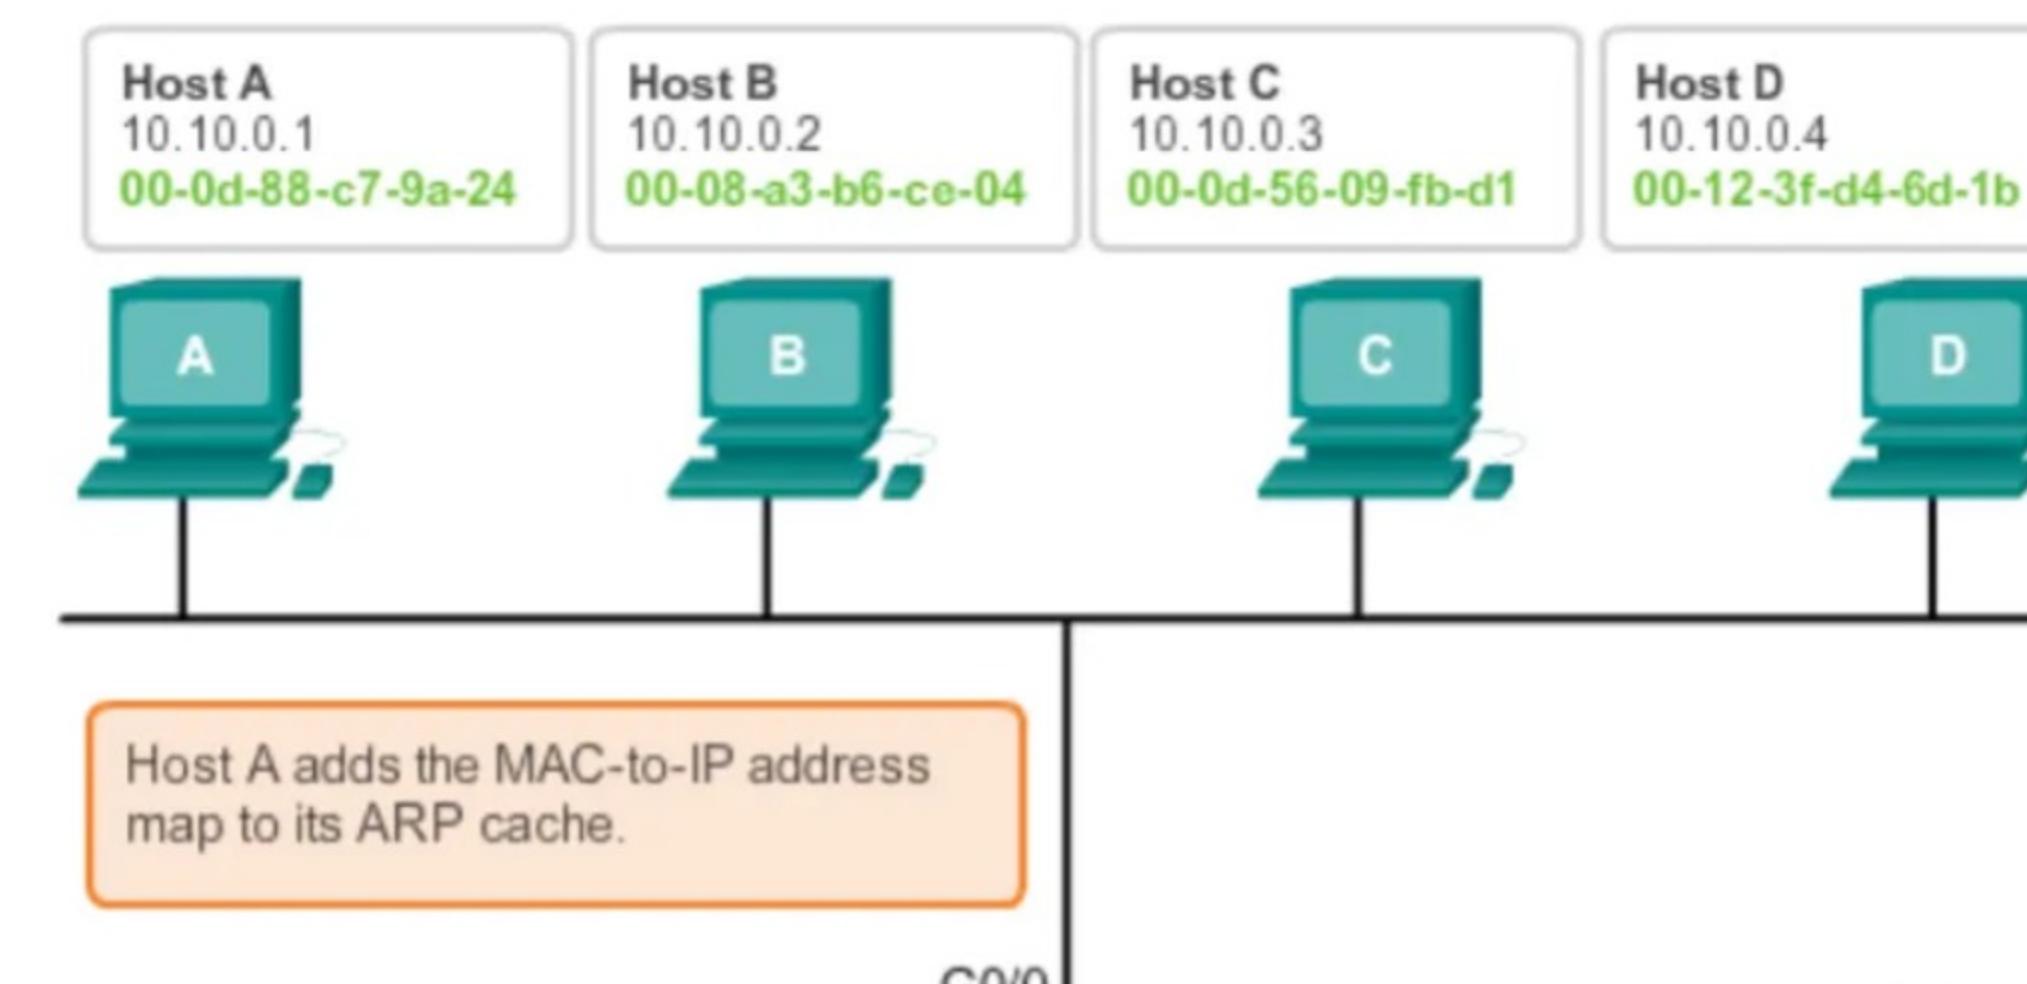

- First, it must **identify if the destination IP address is in the same network or not** by comparing the network portion
 - If there is a **match**, it must use the **destination MAC address** in the **layer 2 header message**.
 - If **not**, it must use the **MAC address of the default gateway**.

⇒ It need to send an ARP request only if the binding information of the next hop is not in the ARP table.

- ARP Request:

- A Layer 2 broadcast frame, with no IP header, containing target IP information.

- ARP Operation

4. ARP table

- All IP-enabled devices have a local memory space for the ARP table

- The ARP table can be manually cleared by the administrator

- IP-to-MAC bindings do not stay in the ARP cache indefinitely

- Bindings will be removed after a pre-determined timeout timer expired

- If the ARP table is running out of space, older entries are **removed** to make space for new ones

5. Quizzes

Refer to the diagram. PC1 sends an ARP request for PC4's MAC address.

Drag and drop a packet onto each device that receives this request.

Host A (192.168.1.1) 00-0d-88-c7-9a-24

Host B (192.168.1.2) 00-08-a3-b6-ce-04
